# Duralex BLOCK & RENDER FILLER

Most cement blocks are pitted with indentations and have a ROUGH surface. Some cement render where coarse river sand is used, also has a ROUGH finish.

## **NOT ALL CEMENT RENDER IS ROUGH.**

Therefore, for ROUGH surfaces there clearly exists the need for a filler.

By DEFINITION, a filler is a preparation of paste-like consistency applied to eliminate minor surface defects and/or to produce a smooth even surface prior to painting. (Courtesy of Standards Australia and Standards New Zealand).

Some people use Block and Render Filler on smooth surfaces, and are met with problems, overlooking label directions clearly stating 'rough cement blockwork' and 'coarse cement render'.

For defect free cement blocks and render there is no need for a filler and Duralex finishing paints should be applied direct to the cleaned surface.
